

PAUL — Protect & Audit Ubiquitous Libraries

The Identity Management safety net your organization doesn't know it needs — until it's too late.

<60s Incident detection	<15m Incident recovery	24/7 Automated monitoring	100% Configurable
--------------------------------------	-------------------------------------	-------------------------------------	-----------------------------

● The Cost of One Incident

Every organization running OpenText Identity Manager faces an unspoken risk: one bad data feed, one policy error, and thousands of users lose access across multiple connected systems. Native IDM has no circuit breaker. **PAUL stops catastrophes before they make hard-to-repair damages. PAUL also monitor & audit critical changes.**

✗ WITHOUT PAUL 2–5 days Manual recovery after incident 2+ weeks Audit log correlation €50K+ Estimated cost per major incident	✓ WITH PAUL <15 min Review, approve, resume <1 hour On-demand audit data <€1K Incidents up to 99.9% avoided
--	---

● Regulatory Compliance Needs Are Real

NIS2 Operational resilience, incident response, access governance → Automated disaster prevention, centralized audit trail	DORA ICT risk management, incident reporting, resilience testing → Threshold-based protection & alerts, critical changes history	SOX Internal controls over access, audit evidence → History of previous access with timestamp, change audit trail per User	HIPAA Access controls, workforce security, audit trails → Access rights supervision & history, automated notifications
---	---	---	---

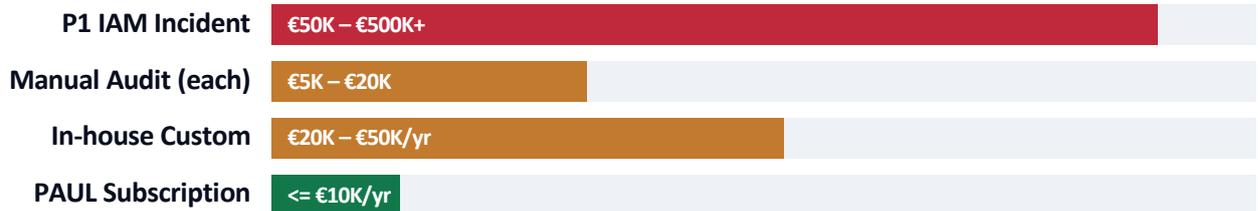

● What PAUL Delivers

 <h3>Disaster Prevention</h3> <ul style="list-style-type: none"> Monitors transactions flow across any IDM driver in real-time, Detects abnormal patterns and pauses processing + alert admins. Minimize damage in connected systems & accelerates recovery. 	 <h3>Centralized Audit</h3> <ul style="list-style-type: none"> Tracks critical actions across IDM and provide User-based view. Configurable attribute change and role assignment history with timestamped previous values centralized per User. 	 <h3>Proactive Detection</h3> <ul style="list-style-type: none"> Real-time email notifications when thresholds trigger. Detect Roles and/or critical attributes changes. Simple configuration: no code needed.
--	--	--

● Proven: Real Disasters Prevented

 <p>CORRUPTED HR FEED</p> <p>Would have disabled ~500 users across every connected system on a Friday night. PAUL detected the spike and paused processing.</p> <p>✓ 2 Users impacted & recovered.</p>	 <p>POLICY MIGRATION ERROR</p> <p>Mass group membership removal triggered. PAUL halted after 12 events instead of the 4,000+ that would have been affected.</p> <p>✓ Exposure: under 30 seconds.</p>	 <p>BULK UPLOAD ERROR</p> <p>Wrong attribute mappings would have overwritten login IDs on 2,000+ accounts, locking users out.</p> <p>✓ 99.8% of events blocked.</p>
--	--	---

● The ROI Argument

→ PAUL pays for itself the first time it prevents an incident. Everything after is pure savings.

● Why PAUL — Not the Alternatives

Alternative	The Problem	PAUL Advantage
Custom Scripts	Fragile, person-dependent, rebuilt every upgrade	Production-hardened, documented, vendor-supported
SIEM Detection	Detects after the fact; cannot stop IDM processing	In-line: detects AND intervenes before damage is too big
Manual Monitoring	Impractical at scale; depends on human availability & efficiency	Automated, 24/7, event-based
IGA Replacement	Massive cost; multi-year migration effort	Protects your existing NetIQ investment

● Pricing — Simple & Transparent

<p>STARTER PACK</p> <p>First 1K users</p> <hr/> <p>ONBOARDING FEE €5,000</p> <hr/> <p>SUBSCRIPTION €5,000 / year</p>	<p>EXTRA USERS</p> <p>Packs of 1k users</p> <hr/> <p>ONBOARDING FEE FREE</p> <hr/> <p>SUBSCRIPTION €500 / year</p>	<p>ENTERPRISE</p> <p>20k + users</p> <hr/> <p>Dedicated support Custom SLA Priority rollout</p> <hr/> <p>Custom</p>
---	---	---

● Getting Started

 <p><2 Weeks</p> <p>Time to value</p>	 <p>Zero</p> <p>Extra infrastructure</p>	 <p>Zero</p> <p>Disruption to env</p>	 <p>3–5 Days</p> <p>Implementation time</p>
